Instr	uctions: Answer all					
Q.	Question	Marks	BL	CO	PO	PI
No						Code
1	A data structure that can store related information	1	L1	1	2	2.5.1
	together is called					
	(a) Array					
	(b) String					
	(c) Structure					
	(d) All of these	4	T 4			4 = 4
2	Which notation comprises a set of all functions h(n)	1	L1	1	1	1.7.1
	that are greater than or equal to $cg(n)$ for all values of					
	$n \ge n0$?					
	(a) Omega notation					
	(b) Big O notation (c) Small o notation					
	(d) Theta Notation					
3	What will be the output for the following C code?	1	L2	1	1	1.7.1
	#include <stdio.h></stdio.h>	_		_	_	10,01
	void main() {					
	int a[] = $\{8,7,3,2,4\}$, *p;					
	p = a;					
	++*p;					
	printf("%d ", *p);					
	p += 2;					
	printf("%d ", *p);					
	}					
	a) 2 4					
	b) 3 4					
	c) 9 3					

	d) 2 3					
4	How do you access Employee's salary for the given	1	L1	1	2	2.5.2
	structure?					
	struct Employee					
	struct Employee					
	int employee_id;					
	char name[20];					
	int salary;					
	} ;					
	struct Organisation					
	{					
	char organisation_name[20];					
	char org_number[20]; struct Employee emp;					
	org;					
	יס-״					
	a) salary.org.emp					
	b) org.emp.salary					
	c) salary.emp.org					
	d) emp.org.salary					
5	What is the function of realloc()?	1	L1	1	2	2.5.1
	(a) Change the location of memory allocated by					
	malloc() or calloc().					
	(b) Reallocates memory deleted by free()					
	function.					
	(c) It is used to modify the size of the previously					
	allocated memory space.					
	(d) None of these					
6	Identify the option which is NOT true about an array?	1	L1	2	2	2.5.1
	a. A zero index is used to refer to the first element	_		_	_	
	b. It understands the concept of ordered elements.					
	c. Duplicate values are allowed					
	d. Expand automatically when an array is full.					
7	Which of the following information is stored in a	1	L1	2	2	2.5.3
	doubly-linked list's nodes? a. Value of node					
	b. Address of next node					
	c. Address of the previous node					
	d. All of the above					
8	In a Circular linked list organization, insertion of a	1	L1	2	2	2.5.1
	record involves the modification of					
	a. No pointer					
	b. 1 pointer					
	c. 2 pointer					
	d. 3 pointer					

of the following data structures? a) Linked List b) Trees c) Stacks d) Priority Queue 10 Which of the following is a practical example of a doubly linked list? a) A browser cookie file. b) A quest in a game that lets users retry stages. c) A game in which the player runs forward. d) A first-in-first out scheduling system. Part - B (4 x 5 = 20 Marks) Instructions: Answer ALL 11 Create pointers to structures named dog. Input dogname, breed, age, color. Print the details of the dog. Mandatory condition: use only . and *. Do not use -> Answer: #include <stdio.h> #include <stdio.h> #include <stdib.h> // Define the dog structure struct Dog { char name[50]; char breed[50]; int age; char color[50]; }; int main() { // Declare a dog structure struct Dog myDog; // Input dog details using pointers and dot (.) printf("Enter dog's name: ");</stdib.h></stdio.h></stdio.h>	9	Polynomial addition can be implemented using which	1	L2	2	1	1.7.1
b) Trees c) Stacks d) Priority Queue 10 Which of the following is a practical example of a doubtly linked list? a) A browser cookie file. b) A quest in a game that lets users retry stages. c) A game in which the player runs forward. d) A first-in-first out scheduling system. Part - B (4 x 5 = 20 Marks) Instructions: Answer ALL 11 Create pointers to structures named dog. Input dogname, breed, age, color. Print the details of the dog. Mandatory condition: use only . and *. Do not use -> Answer: #include <stdio.h> #include <stdlib.h> // Define the dog structure struct Dog { char name[50]; char breed[50]; int age; char color[50]; }; int main() { // Declare a dog structure struct Dog myDog; // Input dog details using pointers and dot (.) printf("Enter dog's name: ");</stdlib.h></stdio.h>		, ·	_		_	_

	}					
12	Write a self-referential structure and implement any one of the dynamic memory allocation techniques on the self-referential structure.	5	L3	1	2	2.6.3
	<pre>// Define a self-referential structure for a singly linked list node struct Node { int data; struct Node *next; // Pointer to the next node in the list };</pre>					
	<pre>int main() { // Create nodes dynamically and build a linked list struct Node *head = NULL; // Initialize the list as empty // Add nodes to the linked list for (int i = 1; i <= 5; i++) { // Create a new node</pre>					
	struct Node *newNode = (struct Node *)malloc(sizeof(struct Node));					
	<pre>// Check if memory allocation was successful if (newNode == NULL) { printf("Memory allocation failed.\n"); return 1; // Exit with an error code }</pre>					
	// Assign data to the new node newNode->data = i;					
	// Make the new node point to the current head of the list					

	newNode->next = head;					
	<pre>// Update the head to point to the new node, making it the new head head = newNode; } // Traverse and print the linked list printf("Linked List: "); struct Node *current = head; while (current != NULL) { printf("%d -> ", current->data); current = current->next; } return 0; }</pre>					
13	Write a program to print the total number of occurrences of a given item in the linked list.	5	L3	2	2	2.5.2
	// Function to count the occurrences of a given item in the linked list int countOccurrences(struct Node *head, int item) { int count = 0; struct Node *current = head; while (current != NULL) { if (current->data == item) { count++; } current = current->next; } return count;					
14	The fruit vendor, Anwar, wants to count every apple in the basket. We must create software that can handle n numbers of apples and display the count for each number because the apples are numbered. Write the appropriate pseudocode. #include <stdio.h> int main() { int n, i;</stdio.h>	5	L3	2	2	2.5.2
	<pre>// Input the total number of apples in the basket printf("Enter the total number of apples: "); scanf("%d", &n); // Declare an array to store counts for each apple number int appleCounts[1000] = {0}; // Assuming apple</pre>					
	numbers are between 1 and 1000 // Input and count each apple					
	* * * * * * * * * * * * * * * * * * *	1	1			ı

for (i = 0; i < n; i++) { int appleNumber; printf("Enter the apple number %d: ", i + 1); scanf("%d", &appleNumber); // Increment the count for the corresponding apple number in the array appleCounts[appleNumber]++; } // Display the count for each apple number printf("Apple Counts:\n");					
for (i = 1; i <= 1000; i++) { // Assuming apple numbers are between 1 and 1000 if (appleCounts[i] > 0) { printf("Apple number %d: Count %d\n", i, appleCounts[i]); } } return 0; }					
Part – C		l	l	l	
(2 x 10 = 20 Marks) Instructions: Answer TWO Questions					
15 Consider a goods train, which initially has an engine as a header. Later compartments are linked with engines one by one in series. The compartments can be attached or detached with the engine or in between. Implement a data structure for the following operations in the goods train 1. Attaching a compartment with the engine Ans: Step 1: IF AVAIL = NULL Write OVERFLOW Go to Step 12 [END OF IF] Step 2: SET = AVAIL Step 3: SET AVAIL = AVAIL NEXT Step 4: SET DATA = VAL Step 5: SET PTR = START Step 6: SET PREPTR = PTR Step 7: Repeat Steps 8 and 9 while != NUM Step 8: SET PREPTR = PTR Step 9: SET PTR = PTR NEXT [END OF LOOP] Step 1: PREPTR NEXT = Step 11: SET NEW_NODE NEXT = PTR Step 12: EXIT 2. Detaching a compartment from the engine	10	L3	1	1	1.7.1
Step 1: IF START = NULL					
Ans					

	Write UNDERFLOW Go to Step 1 [END OF IF] Step 2: SET PTR = START Step 3: SET PREPTR = PTR Step 4: Repeat Steps 5 and 6 while PREPTR DATA! = NUM Step 5: SET PREPTR = PTR Step 6: SET PTR = PTR NEXT [END OF LOOP] Step 7: SET TEMP = PTR Step 8: SET PREPTR NEXT = PTR NEXT Step 9: FREE TEMP Step 1: EXIT					
1.6	(or)	F . 5	1.2	1	1	171
16.	a) Find the tight bound of running time of a cubic function. $f(n) = 2n3+3n+6$; $g(n) = n3$ $f(n) = \theta(g(n)) = O(n^3) \text{ for } c_1=2, c_2=11, n_0=1 \text{ (with proper derivation)} - \textbf{5 Marks}$ b) Prove that $10n3 + 20n \neq O(n2)$ Since $f(n)$ is greater than $g(n)$, it is not possible to find tightest upper bound using the given $g(n)$. If the proper justification is given with examples $\textbf{5}$ marks can be awarded.		L3	1	1	1.7.1
17	Consider a data structure with the elements 22,32,44,51,65,71,80 which are stored in adjacent memory locations. The element 44 needs to be deleted first and after that you want to insert the data element 92 at the 4 th position. Write the appropriate pseudo code to perform the aforementioned operations and provide a pictorial representation of it. #include <stdio.h> int main() { int data[] = {22, 32, 44, 51, 65, 71, 80}; int n = sizeof(data) / sizeof(data[0]); // Pictorial representation before deletion and insertion printf("Before:\n");</stdio.h>	10	L3	2	2	2.5.2

```
for (int i = 0; i < n; i++) {
     printf("%d ", data[i]);
  }
  printf("\n");
  // Deleting element 44 (3rd position)
  int deleteIndex = 2; // Index of element to be deleted
  for (int i = deleteIndex; i < n - 1; i++) {
     data[i] = data[i + 1];
  }
  n--; // Reduce the size of the array
  // Inserting element 92 at the 4th position (3rd
index)
  int insertIndex = 3; // Index where element 92 will
be inserted
  for (int i = n; i > insertIndex; i--) {
     data[i] = data[i - 1];
  }
  data[insertIndex] = 92;
  n++; // Increase the size of the array
  // Pictorial representation after deletion and
insertion
  printf("After:\n");
  for (int i = 0; i < n; i++) {
     printf("%d ", data[i]);
  }
  printf("\n");
```
